Welcome to PortSIP UC SDK For Android

Create your SIP-based application for multiple platforms (iOS, Android, Windows, Mac OS and Linux) with our SDK.

The rewarding PortSIP UC SDK is a powerful and versatile set of tools that dramatically accelerate SIP application development. It includes a suite of stacks, SDKs, and some Sample projects, with each of them enables developers to combine all the necessary components to create an ideal development environment for every application's specific needs.

The PortSIP UC SDK complies with IETF and 3GPP standards, and is IMS-compliant (3GPP/3GPP2, TISPAN and PacketCable 2.0). These high performance SDKs provide unified API layers for full user control and flexibility.

Getting Started

You can download PortSIP UC SDK Sample projects at our Website. Samples include demos for VC++, C#, VB.NET, Delphi XE, XCode (for iOS and Mac OS), Eclipse (Java for Android) with the sample project source code provided (with SDK source code exclusive). The sample projects demonstrate how to create a powerful SIP application with our SDK easily and quickly.

Contents

The sample package for downloading contains almost all of materials for PortSIP SDK: documentation, Dynamic/Static libraries, sources, headers, datasheet, and everything else a SDK user might need!

SDK User Manual

To be started with, it is recommended to read the documentation of PortSIP UC SDK, <u>SDK</u> <u>User Manual page</u>, which gives a brief description of each API function.

Website

Some general interest or often changing PortSIP SDK information will be posted on the PortSIP website in real time. The release contains links to the site, so while browsing you may see occasional broken links if you are not connected to the Internet. To be sure everything needed for using the PortSIP UC SDK has been contained within the release.

Support

Please send email to our **Support team** if you need any help.

Installation Prerequisites

To use PortSIP VoIP/IMS SDK for Android for development, SDK version with later than API-16 is required.

Frequently Asked Questions

1. Does PortSIP UC SDK is free?

Yes, the PortSIP UC SDK is totally free, but it was limited only works with PortSIP PBX.

2. What is the difference between PortSIP UC SDK and PortSIP VoIP SDK?

The <u>PortSIP UC SDK</u> is free, but was limited to works with <u>PortSIP PBX</u>; The <u>PortSIP VoIP SDK</u> is not free that can works with any 3rd SIP based PBX. The UC SDK also have a lot of unique features than the VoIP SDK which provided by <u>PortSIP PBX</u>.

3. Where can I download the PortSIP UC SDK for test?

All sample projects of the PortSIP UC SDK can be found and downloaded at: https://www.portsip.com/download-portsip-uc-sdk/

4. How can I compile the sample project?

- 1. Download the sample project from PortSIP website.
- 2. Extract the .zip file.
- 3. Open the project by your Eclipse or Android studio:
- 4. Compile the sample project directly.

5. How can I create a new project with PortSIP VoIP SDK?

- 1. Download the sample project and evaluation SDK and extract it to a specified directory
- 2. Run Android Studio and create a new Android Application Project
- 3. Copy all files form libs directory under extracted directory to the libs directory of your new application.
- 4. Import the dependent class form the SDK. For example: import com.portsip.OnPortSIPEvent; import com.portsip.PortSipSdk;
- 5. Inherit the interface OnPortSIPEvent to process the callback events.
- Initialize SDK. For example: mPortSIPSDK = new PortSipSdk(); mPortSIPSDK.setOnPortSIPEvent(instanceofOnPortSIPEvent); mPortSIPSDK.CreateCallManager(context); mPortSIPSDK.initialize(...); For more details please refer to the Sample project source code.

6. Is the SDK thread safe?

Yes, the SDK is thread safe. You can call any of the API functions without the need to consider the multiple threads. Note: the SDK allows to call API functions in callback events directly - except for the "onAudioRawCallback", "onVideoRawCallback", "onReceivedRtpPacket", "onSendingRtpPacket" callbacks.

Module Index

Modules

Here is a list of all modules: SDK Callback events 9 Call events 10 Presence events 18 Play audio and video file finished events 21 SDK functions 23 Initialize and register functions. 23 Audio and video codecs functions 27 Refer functions 44 Record functions 49 Play audio and video file to remote functions. 50 Conference functions 52 RTP and RTCP QOS functions 53 Audio effect functions 56

Module Documentation

SDK Callback events

SDK Callback events.

Modules

- Register events
 Register events.
- Call events
- Refer events
- Signaling events
- MWI events
- DTMF events
- INFO/OPTIONS message events
- Presence events
- Play audio and video file finished events
- RTP callback events

Detailed Description

SDK Callback events.

Register events

Register events.

Functions

- void com.portsip.OnPortSIPEvent.onRegisterSuccess (String reason, int code, String sipMessage)
- void <u>com.portsip.OnPortSIPEvent.onRegisterFailure</u> (String reason, int code, String sipMessage)

Detailed Description

Register events.

Function Documentation

void com.portsip.OnPortSIPEvent.onRegisterSuccess (String reason, int code, String sipMessage)

When successfully registered to server, this event will be triggered.

reason	The status text.
code	The status code.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onRegisterFailure (String reason, int code, String sipMessage)

If failed to register to SIP server, this event will be triggered.

Parameters

reason	The status text.
code	The status code.
sipMessage	The SIP message received.

Call events

Functions

- void <u>com.portsip.OnPortSIPEvent.onInviteIncoming</u> (long sessionId, String callerDisplayName, String caller, String calleeDisplayName, String callee, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo, String sipMessage)
- void com.portsip.OnPortSIPEvent.onInviteTrying (long sessionId)
- void <u>com.portsip.OnPortSIPEvent.onInviteSessionProgress</u> (long sessionId, String audioCodecs, String videoCodecs, boolean existsEarlyMedia, boolean existsAudio, boolean existsVideo, String sipMessage)
- void com.portsip.OnPortSIPEvent.onInviteRinging (long sessionId, String statusText, int statusCode, String sipMessage)
- void <u>com.portsip.OnPortSIPEvent.onInviteAnswered</u> (long sessionId, String callerDisplayName, String caller, String calleeDisplayName, String callee, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo, String sipMessage)
- void <u>com.portsip.OnPortSIPEvent.onInviteFailure</u> (long sessionId, String reason, int code, String sipMessage)
- void com.portsip.OnPortSIPEvent.onInviteUpdated (long sessionId, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo, String sipMessage)
- void <u>com.portsip.OnPortSIPEvent.onInviteConnected</u> (long sessionId)
- void com.portsip.OnPortSIPEvent.onInviteBeginingForward (String forwardTo)
- void <u>com.portsip.OnPortSIPEvent.onInviteClosed</u> (long sessionId)
- void <u>com.portsip.OnPortSIPEvent.onDialogStateUpdated</u> (String BLFMonitoredUri, String BLFDialogState, String BLFDialogId, String BLFDialogDirection)
- void com.portsip.OnPortSIPEvent.onRemoteHold (long sessionId)
- void com.portsip.OnPortSIPEvent.onRemoteUnHold (long sessionId, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onInviteIncoming (long sessionId, String callerDisplayName, String caller, String calleeDisplayName, String callee, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo, String sipMessage)

When a call is coming, this event will be triggered.

sessionId	The session ID of the call.
callerDisplayNam	The display name of caller
e	

caller	The caller.
calleeDisplayNam	The display name of callee.
e	
callee	The callee.
audioCodecs	The matched audio codecs. It's separated by "#" if there are more than one
	codecs.
videoCodecs	The matched video codecs. It's separated by "#" if there are more than one
	codecs.
<i>existsAudio</i>	By setting to true, it means that this call include the audio.
existsVideo	By setting to true, it means that this call include the video.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onInviteTrying (long sessionId)

If the outgoing call is being processed, this event will be triggered.

Parameters

sessionId	The session ID of the call.

void com.portsip.OnPortSIPEvent.onInviteSessionProgress (long sessionId, String audioCodecs, String videoCodecs, boolean existsEarlyMedia, boolean existsAudio, boolean existsVideo, String sipMessage)

Once the caller received the "183 session progress" message, this event would be triggered.

Parameters

sessionId	The session ID of the call.
audioCodecs	The matched audio codecs. It's separated by "#" if there are more than one
	codecs.
videoCodecs	The matched video codecs. It's separated by "#" if there are more than one
	codecs.
existsEarlyMedia	By setting to true it means the call has early media.
<i>existsAudio</i>	By setting to true it means this call include the audio.
existsVideo	By setting to true it means this call include the video.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onInviteRinging (long sessionId, String statusText, int statusCode, String sipMessage)

If the outgoing call is ringing, this event will be triggered.

Parameters

sessionId	The session ID of the call.
statusText	The status text.
statusCode	The status code.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onInviteAnswered (long sessionId, String callerDisplayName, String caller, String calleeDisplayName, String callee, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo, String sipMessage)

If the remote party answered the call, this event would be triggered.

sessionId	The session ID of the call.
callerDisplayNam	The display name of caller
e	
caller	The caller.
calleeDisplayNam	The display name of callee.
e	

callee	The callee.
audioCodecs	The matched audio codecs. It's separated by "#" if there are more than one
	codecs.
videoCodecs	The matched video codecs. It's separated by "#" if there are more than one
	codecs.
<i>existsAudio</i>	By setting to true, this call includes the audio.
existsVideo	By setting to true, this call includes the video.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onInviteFailure (long sessionId, String reason, int code, String sipMessage)

This event will be triggered if the outgoing call fails.

Parameters

sessionId	The session ID of the call.
reason	The failure reason.
code	The failure code.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onInviteUpdated (long sessionId, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo, String sipMessage)

This event will be triggered when remote party updates the call.

Parameters

sessionId	The session ID of the call.
audioCodecs	The matched audio codecs. It's separated by "#" if there are more than one
	codecs.
videoCodecs	The matched video codecs. It's separated by "#" if there are more than one
	codecs.
<i>existsAudio</i>	By setting to true, this call includes the audio.
exists Video	By setting to true, this call includes the video.
sipMessage	The SIP message received.

void com.portsip.OnPortSIPEvent.onInviteConnected (long sessionId)

This event will be triggered when UAC sent/UAS received ACK (the call is connected). Some functions (hold, updateCall etc...) can be called only after the call connected, otherwise the functions will return error.

Parameters

sessionId The session ID of the call.

void com.portsip.OnPortSIPEvent.onInviteBeginingForward (String forwardTo)

If the enableCallForward method is called and a call is incoming, the call will be forwarded automatically and this event will be triggered.

Parameters

forwardTo The target SIP URI of the call forwarding.	

void com.portsip.OnPortSIPEvent.onInviteClosed (long sessionId)

This event is triggered once remote side ends the call.

sessionId	The session ID of the call.

void com.portsip.OnPortSIPEvent.onDialogStateUpdated (String BLFMonitoredUri, String BLFDialogState, String BLFDialogDirection)

If a user subscribed and his dialog status monitored, when the monitored user is holding a call or is being rang, this event will be triggered.

Parameters

<i>BLFMonitoredUri</i>	the monitored user's URI
BLFDialogState	- the status of the call
BLFDialogId	- the id of the call
<i>BLFDialogDirecti</i>	- the direction of the call
on	

void com.portsip.OnPortSIPEvent.onRemoteHold (long sessionId)

If the remote side places the call on hold, this event will be triggered.

Parameters

	sessionId	The session ID of the call.

void com.portsip.OnPortSIPEvent.onRemoteUnHold (long sessionId, String audioCodecs, String videoCodecs, boolean existsAudio, boolean existsVideo)

If the remote side un-holds the call, this event will be triggered

Parameters

sessionId	The session ID of the call.
audioCodecs	The matched audio codecs. It's separated by "#" if there are more than one
	codec.
videoCodecs	The matched video codecs. It's separated by "#" if there are more than one
	codec.
<i>existsAudio</i>	By setting to true, this call includes the audio.
existsVideo	By setting to true, this call includes the video.

Refer events

Functions

- void <u>com.portsip.OnPortSIPEvent.onReceivedRefer</u> (long sessionId, long referId, String to, String from, String referSipMessage)
- void <u>com.portsip.OnPortSIPEvent.onReferAccepted</u> (long sessionId)
- void com.portsip.OnPortSIPEvent.onReferRejected (long sessionId, String reason, int code)
- void <u>com.portsip.OnPortSIPEvent.onTransferTrying</u> (long sessionId)
- void com.portsip.OnPortSIPEvent.onTransferRinging (long sessionId)
- void <u>com.portsip.OnPortSIPEvent.onACTVTransferSuccess</u> (long sessionId)
- void <u>com.portsip.OnPortSIPEvent.onACTVTransferFailure</u> (long sessionId, String reason, int code)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onReceivedRefer (long sessionId, long referId, String to, String from, String referSipMessage)

This event will be triggered once received a REFER message.

Parameters

sessionId	The session ID of the call.
referId	The ID of the REFER message. Pass it to acceptRefer or rejectRefer
to	The refer target.
from	The sender of REFER message.
referSipMessage	The SIP message of "REFER". Pass it to "acceptRefer" function.

void com.portsip.OnPortSIPEvent.onReferAccepted (long sessionId)

This callback will be triggered once remote side calls "acceptRefer" to accept the REFER

Parameters

sessionId	The session ID of the call.

void com.portsip.OnPortSIPEvent.onReferRejected (long sessionId, String reason, int code)

This callback will be triggered once remote side calls "rejectRefer" to reject the REFER

Parameters

sessionId	The session ID of the call.
reason	Reject reason.
code	Reject code.

void com.portsip.OnPortSIPEvent.onTransferTrying (long sessionId)

When the refer call is being processed, this event will be triggered.

Parameters

Ξ.		
	sessionId	The session ID of the call.

void com.portsip.OnPortSIPEvent.onTransferRinging (long sessionId)

When the refer call is ringing, this event will be triggered.

Parameters

|--|

void com.portsip.OnPortSIPEvent.onACTVTransferSuccess (long sessionId)

When the refer call succeeds, this event will be triggered. The ACTV means Active. For example, A establishes the call with B, A transfers B to C, C accepts the refer call, and A will receive this event.

Parameters

sessionId	The session ID of the call.

void com.portsip.OnPortSIPEvent.onACTVTransferFailure (long sessionId, String reason, int code)

When the refer call fails, this event will be triggered. The ACTV means Active. For example, A establish the call with B, A transfers B to C, C rejects this refer call, and A will receive this event.

-				
	sessionId	The session ID of the call.		

reason	The error reason.
code	The error code.

Signaling events

Functions

- void <u>com.portsip.OnPortSIPEvent.onReceivedSignaling</u> (long sessionId, String message)
- void com.portsip.OnPortSIPEvent.onSendingSignaling (long sessionId, String message)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onReceivedSignaling (long sessionId, String message)

This event will be triggered when receiving a SIP message. This event is disabled by default. To enable, use enableCallbackSignaling.

Parameters

sessionId	The session ID of the call.
message	The received SIP message.

void com.portsip.OnPortSIPEvent.onSendingSignaling (long sessionId, String message)

This event will be triggered when sent a SIP message. This event is disabled by default. To enable, use enableCallbackSignaling.

Parameters

sessionId	The session ID of the call.
message	The sent SIP message.

MWI events

Functions

- void <u>com.portsip.OnPortSIPEvent.onWaitingVoiceMessage</u> (String messageAccount, int urgentNewMessageCount, int urgentOldMessageCount, int newMessageCount, int oldMessageCount)
- void <u>com.portsip.OnPortSIPEvent.onWaitingFaxMessage</u> (String messageAccount, int urgentNewMessageCount, int urgentOldMessageCount, int newMessageCount, int oldMessageCount)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onWaitingVoiceMessage (String messageAccount, int urgentNewMessageCount, int urgentOldMessageCount, int newMessageCount, int oldMessageCount)

If there is the waiting voice message (MWI), this event will be triggered.

Parameters

messageAccount	Voice message account
urgentNewMessag	Count of new urgent messages.
eCount	
urgentOldMessage	Count of history urgent message.
Count	
newMessageCount	Count of new messages.
oldMessageCount	Count of history messages.

void com.portsip.OnPortSIPEvent.onWaitingFaxMessage (String messageAccount, int urgentNewMessageCount, int urgentOldMessageCount, int oldMessageCount)

If there is waiting fax message (MWI), this event will be triggered.

Parameters

messageAccount	Fax message account
urgentNewMessag	Count of new urgent messages.
eCount	
urgentOldMessage	Count of history urgent messages.
Count	
newMessageCount	Count of new messages.
oldMessageCount	Count of old messages.

DTMF events

Functions

• void <u>com.portsip.OnPortSIPEvent.onRecvDtmfTone</u> (long sessionId, int tone)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onRecvDtmfTone (long sessionId, int tone)

This event will be triggered when receiving a DTMF tone from remote side.

Parameters

	sessionId	Session ID of the call.	
	tone		
code			Description
0			The DTMF tone 0.
1			The DTMF tone 1

The DTMF tone 2.

3	The DTMF tone 3.
4	The DTMF tone 4.
5	The DTMF tone 5.
6	The DTMF tone 6.
7	The DTMF tone 7.
8	The DTMF tone 8.
9	The DTMF tone 9.
10	The DTMF tone *.
11	The DTMF tone #.
12	The DTMF tone A.
13	The DTMF tone B.
14	The DTMF tone C.
15	The DTMF tone D.
16	The DTMF tone FLASH.

INFO/OPTIONS message events

Functions

- void <u>com.portsip.OnPortSIPEvent.onRecvOptions</u> (String optionsMessage)
- void <u>com.portsip.OnPortSIPEvent.onRecvInfo</u> (String infoMessage)
- void com.portsip.OnPortSIPEvent.onRecvNotifyOfSubscription (long subscribeId, String notifyMessage, byte[] messageData, int messageDataLength)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onRecvOptions (String optionsMessage)

This event will be triggered when receiving the OPTIONS message.

Parameters

optionsMessage The received whole OPTIONS message in text format.	optionsMessage	eived whole OPTIONS message in text format.
---	----------------	---

void com.portsip.OnPortSIPEvent.onRecvInfo (String infoMessage)

This event will be triggered when receiving the INFO message.

Parameters

infoMessage	The whole INFO message received in text format.

void com.portsip.OnPortSIPEvent.onRecvNotifyOfSubscription (long subscribeld, String notifyMessage, byte[] messageData, int messageDataLength)

This event will be triggered when receiving a NOTIFY message of the subscription.

subscribeId	The ID of SUBSCRIBE request.
notifyMessage	The received INFO message in text format.
messageData	The received message body. It's can be either text or binary data.

messageDataLengt	The length of "messageData".
h	

Presence events

Functions

- void <u>com.portsip.OnPortSIPEvent.onPresenceRecvSubscribe</u> (long subscribeId, String fromDisplayName, String from, String subject)
- void com.portsip.OnPortSIPEvent.onPresenceOnline (String fromDisplayName, String from, String stateText)
- void <u>com.portsip.OnPortSIPEvent.onPresenceOffline</u> (String fromDisplayName, String from)
- void com.portsip.OnPortSIPEvent.onRecvMessage (long sessionId, String mimeType, String subMimeType, byte[] messageData, int messageDataLength)
- void <u>com.portsip.OnPortSIPEvent.onRecvOutOfDialogMessage</u> (String fromDisplayName, String from, String toDisplayName, String to, String mimeType, String subMimeType, byte[] messageData_int messageDataLength, String sipMessage)
- void com.portsip.OnPortSIPEvent.onSendMessageSuccess (long sessionId, long messageId)
- void com.portsip.OnPortSIPEvent.onSendMessageFailure (long sessionId, long messageId, String reason, int code)
- void <u>com.portsip.OnPortSIPEvent.onSendOutOfDialogMessageSuccess</u> (long messageId, String fromDisplayName, String from, String toDisplayName, String to)
- void com.portsip.OnPortSIPEvent.onSendOutOfDialogMessageFailure (long messageId, String fromDisplayName, String to, String reason, int code)
- void <u>com.portsip.OnPortSIPEvent.onSubscriptionFailure</u> (long subscribeId, int statusCode)
- void <u>com.portsip.OnPortSIPEvent.onSubscriptionTerminated</u> (long subscribeId)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onPresenceRecvSubscribe (long subscribeld, String fromDisplayName, String from, String subject)

This event will be triggered when receiving the SUBSCRIBE request from a contact.

Parameters

subscribeId	The ID of SUBSCRIBE request.
fromDisplayName	The display name of contact.
from	The contact who sends the SUBSCRIBE request.
subject	The subject of the SUBSCRIBE request.

void com.portsip.OnPortSIPEvent.onPresenceOnline (String fromDisplayName, String from, String stateText)

When the contact is online or changes presence status, this event will be triggered.

fromDisplayName	The display name of contact.
from	The contact who sends the SUBSCRIBE request.
stateText	The presence status text.

void com.portsip.OnPortSIPEvent.onPresenceOffline (String fromDisplayName, String from)

When the contact is offline, this event will be triggered.

Parameters

fromDisplayName	The display name of contact.
from	The contact who sends the SUBSCRIBE request

void com.portsip.OnPortSIPEvent.onRecvMessage (long sessionId, String mimeType, String subMimeType, byte[] messageData, int messageDataLength)

This event will be triggered when receiving a MESSAGE message in dialog.

Parameters

sessionId	The session ID of the call.
mimeType	The message mime type.
subMimeType	The message sub mime type.
messageData	The received message body. It can be text or binary data. Use the mimeType and subMimeType to differentiate them. For example, if the mimeType is "text" and subMimeType is "plain", "messageData" is text message body. If the mimeType is "application" and subMimeType is "vnd.3gpp.sms", "messageData" is binary message body.
messageDataLengt	The length of "messageData".
h	

void com.portsip.OnPortSIPEvent.onRecvOutOfDialogMessage (String fromDisplayName, String from, String toDisplayName, String to, String mimeType, String subMimeType, byte[] messageData, int messageDataLength, String sipMessage)

This event will be triggered when receiving a MESSAGE message out of dialog. For example pager message.

Parameters

fromDisplayName	The display name of sender.
from	The message sender.
toDisplayName	The display name of receiver.
to	The receiver.
mimeType	The message mime type.
subMimeType	The message sub mime type.
messageData	The received message body. It can be text or binary data. Use the mimeType and subMimeType to differentiate them. For example, if the mimeType is "text" and subMimeType is "plain", "messageData" is text message body. If the mimeType is "application" and subMimeType is "vnd.3gpp.sms", "messageData" is binary message body.
messageDataLengt h	The length of "messageData".
sipMessage	The SIP message received.

${\tt void\ com.portsip.OnPortSIPEvent.onSendMessageSuccess\ (long\ sessionId,\ long\ messageId)}$

If the message is sent successfully in dialog, this event will be triggered.

sessionId	The session ID of the call.
messageId	The message ID. It's equal to the return value of sendMessage function.

void com.portsip.OnPortSIPEvent.onSendMessageFailure (long sessionId, long messageId, String reason, int code)

If the message is failed to be sent out of dialog, this event will be triggered.

Parameters

sessionId	The session ID of the call.
messageId	The message ID. It's equal to the return value of sendMessage function.
reason	The failure reason.
code	Failure code.

void com.portsip.OnPortSIPEvent.onSendOutOfDialogMessageSuccess (long messageId, String fromDisplayName, String from, String toDisplayName, String to)

If the message is sent successfully out of dialog, this event will be triggered.

Parameters

messageId	The message ID. It's equal to the return value of SendOutOfDialogMessage
	function.
fromDisplayName	The display name of message sender.
from	The message sender.
toDisplayName	The display name of message receiver.
to	The message receiver.

void com.portsip.OnPortSIPEvent.onSendOutOfDialogMessageFailure (long messageId, String fromDisplayName, String from, String toDisplayName, String to, String reason, int code)

If the message failed to be sent out of dialog, this event would be triggered.

Parameters

messageId	The message ID. It's equal to the return value of SendOutOfDialogMessage
	function.
fromDisplayName	The display name of message sender
from	The message sender.
toDisplayName	The display name of message receiver.
to	The message receiver.
reason	The failure reason.
code	The failure code.

void com.portsip.OnPortSIPEvent.onSubscriptionFailure (long subscribeld, int statusCode)

This event will be triggered on sending SUBSCRIBE failure.

Parameters

subscribeId	The ID of SUBSCRIBE request.
statusCode	The status code.

void com.portsip.OnPortSIPEvent.onSubscriptionTerminated (long subscribeld)

This event will be triggered when a SUBSCRIPTION is terminated or expired.

subscribeId	The ID of SUBSCRIBE request.

Play audio and video file finished events

Functions

- void <u>com.portsip.OnPortSIPEvent.onPlayAudioFileFinished</u> (long sessionId, String fileName)
- void com.portsip.OnPortSIPEvent.onPlayVideoFileFinished (long sessionId)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onPlayAudioFileFinished (long sessionId, String fileName)

If called playAudioFileToRemote function with no loop mode, this event will be triggered once the file play finished.

Parameters

sessionId	The session ID of the call.
fileName	The play file name.

void com.portsip.OnPortSIPEvent.onPlayVideoFileFinished (long sessionId)

If called playVideoFileToRemote function with no loop mode, this event will be triggered once the file play finished.

Parameters

sessionId	The session ID of the call.	
Bessionia	The session in of the cuit.	

RTP callback events

Functions

- void <u>com.portsip.OnPortSIPEvent.onReceivedRTPPacket</u> (long sessionId, boolean isAudio, byte[] RTPPacket, int packetSize)
- void com.portsip.OnPortSIPEvent.onSendingRTPPacket (long sessionId, boolean isAudio, byte[] RTPPacket, int packetSize)
- void com.portsip.OnPortSIPEvent.onAudioRawCallback (long sessionId, int enum audioCallbackMode, byte[] data, int dataLength, int samplingFreqHz)
- void com.portsip.OnPortSIPEvent.onVideoRawCallback (long sessionId, int enum videoCallbackMode, int width, int height, byte[] data, int dataLength)

Detailed Description

Function Documentation

void com.portsip.OnPortSIPEvent.onReceivedRTPPacket (long sessionId, boolean isAudio, byte[] RTPPacket, int packetSize)

If setRTPCallback function is called to enable the RTP callback, this event will be triggered once receiving a RTP packet.

Parameters

sessionId	The session ID of the call.
isAudio	If the received RTP packet is of audio, this parameter returns true; otherwise
	false.
RTPPacket	The memory of whole RTP packet.
packetSize	The size of received RTP Packet. Remarks

Don't call any SDK API functions in this event directly. If you want to call the API functions or other code which is time-consuming, you should post a message to another thread and execute SDK API functions or other code in another thread.

void com.portsip.OnPortSIPEvent.onSendingRTPPacket (long sessionId, boolean isAudio, byte[] RTPPacket, int packetSize)

If setRTPCallback function is called to enable the RTP callback, this event will be triggered once sending a RTP packet.

Parameters

sessionId	The session ID of the call.
isAudio	If the received RTP packet is of audio, this parameter returns true; otherwise
	false.
RTPPacket	The memory of whole RTP packet.
packetSize	The size of received RTP Packet. Remarks

Don't call any SDK API functions in this event directly. If you want to call the API functions or other code which is time-consuming, you should post a message to another thread and execute SDK API functions or other code in another thread.

void com.portsip.OnPortSIPEvent.onAudioRawCallback (long sessionId, int enum audioCallbackMode, byte[] data, int dataLength, int samplingFreqHz)

This event will be triggered once receiving the audio packets if called enableAudioStreamCallback function.

Parameters

sessionId	The session ID of the call.
enum_audioCallba	The type passed in enableAudioStreamCallback function. Below types
ckMode	allowed: ENUM_AUDIOSTREAM_NONE,
	ENUM AUDIOSTREAM LOCAL MIX,
	ENUM AUDIOSTREAM LOCAL PER CHANNEL,
	ENUM_AUDIOSTREAM_REMOTE_MIX,
	ENUM AUDIOSTREAM REMOTE PER CHANNEL.
data	The memory of audio stream. It's in PCM format.
dataLength	The data size.
samplingFreqHz	The audio stream sample in HZ. For example, 8000 or 16000. Remarks

Don't call any SDK API functions in this event directly. If you want to call the API functions or other code which is time-consuming, you should post a message to another thread and execute SDK API functions or other code in another thread.

PortSipSdk::enableAudioStreamCallback

void com.portsip.OnPortSIPEvent.onVideoRawCallback (long sessionId, int enum_videoCallbackMode, int width, int height, byte[] data, int dataLength)

This event will be triggered once receiving the video packets if enableVideoStreamCallback function is called.

Parameters

sessionId	The session ID of the call.
enum_videoCallba	The type which is passed in enableVideoStreamCallback function. Below
ckMode	types allowed: ENUM_VIDEOSTREAM_NONE,
	ENUM_VIDEOSTREAM_LOCAL, ENUM_VIDEOSTREAM_REMOTE,
	ENUM VIDEOSTREAM BOTH.
width	The width of video image.
height	The height of video image.
data	The memory of video stream. It's in YUV420 format, YV12.
dataLength	The data size.

- int com.portsip.PortSipSdk.setDisplayName (String displayName)

Detailed Description

Function Documentation

void com.portsip.PortSipSdk.CreateCallManager (Context context)

Create the callback handlers.

Parameters

context	The context of application.

void com.portsip.PortSipSdk.DeleteCallManager ()

Release the callback Handlers.

int com.portsip.PortSipSdk.initialize (int enum_transport, String localIP, int localSIPPort, int enum_LogLevel, String LogPath, int maxLines, String agent, int audioDeviceLayer, int videoDeviceLayer, String TLSCertificatesRootPath, String TLSCipherList, boolean verifyTLSCertificate, String dnsServers)

Initialize the SDK.

enum transport	Transport for SIP signaling, which can be set as: ENUM TRANSPORT UDP ,
	ENUM TRANSPORT TCP, ENUM TRANSPORT TLS,
	ENUM TRANSPORT PERS. The ENUM_TRANSPORT_PERS_UDP is the
	private PortSIP transport for anti-SIP blocking, which must work with the
	PERS. ENUM TRANSPORT PERS. The
	ENUM_TRANSPORT_PERS_TCP is the private PortSIP transport for
	anti-SIP blocking, which must work with the PERS.
localIP	The local PC IP address (for example: 192.168.1.108). It will be used for
	sending and receiving SIP messages and RTP packets.
	If the local IP is provided in IPv6 format, the SDK will use IPv6.
	If you want the SDK to choose correct network interface (IP) automatically,
	please use "0.0.0.0" for IPv4, or "::" for IPv6.
localSIPPort	The listening port for SIP message transmission, for example 5060.
enum LogLevel	Set the application log level. The SDK will generate
	"PortSIP Log datatime.log" file if the log is enabled.
	ENUM LOG LEVEL NONE ENUM LOG LEVEL DEBUG

ENUM LOG LEVEL ERROR ENUM LOG LEVEL WARNING
ENUM LOG LEVEL INFO ENUM LOG LEVEL DEBUG
The path for storing log file. The path (folder) specified MUST be existent.
Theoretically, unlimited count of lines are supported depending on the device
capability. For SIP client, it is recommended to limit it as ranging 1 - 100.
The User-Agent header to be inserted in to SIP messages.
Specifies the audio device layer that should be using:
0 = Use the OS defaulted device.
1 = Virtual device, usually use this for the device that has no sound device
installed.
Specifies the video device layer that should be using:
0 = Use the OS defaulted device.
1 = Use Virtual device, usually use this for the device that has no camera
installed.
Specify the TLS certificate path, from which the SDK will load the certificates
automatically. Note: On Windows, this path will be ignored, and SDK will
read the certificates from Windows certificates stored area instead.
Specify the TLS cipher list. This parameter is usually passed as empty so that
the SDK will offer all available ciphers.
Indicate if SDK will verify the TLS certificate or not. By setting to false, the
SDK will not verify the validity of TLS certificate.
Additional Nameservers DNS servers. Value null indicates system DNS
Server. Multiple servers will be split by ";", e.g "8.8.8.8;8.8.4.4"

Returns

If the function succeeds, it returns value 0. If the function fails, it will return a specific error code

int com.portsip.PortSipSdk.setInstanceId (String instanceId)

Set the instance Id, the outbound instanceId((RFC5626)) used in contact headers.

Parameters

instanceId	The SIP instance ID. If this function is not called, the SDK will generate an
	instance ID automatically. The instance ID MUST be unique on the same
	device (device ID or IMEI ID is recommended). Recommend to call this
	function to set the ID on Android devices.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setUser (String userName, String displayName, String authName, String password, String userDomain, String SIPServer, int SIPServerPort, String STUNServer, int STUNServerPort, String outboundServer, int outboundServerPort)

Set user account info.

userName	Account (username) of the SIP, usually provided by an IP-Telephony service
	provider.
displayName	The name displayed. You can set it as your like, such as "James Kend". It's
	optional.
authName	Authorization user name (usually equal to the username).
password	User's password. It's optional.
userDomain	User domain; this parameter is optional, which allows to transfer an empty
	string if you are not using the domain.
SIPServer	SIP proxy server IP or domain, for example xx.xxx.xx.x or sip.xxx.com.
SIPServerPort	Port of the SIP proxy server, for example 5060.

STUNServer	Stun server for NAT traversal. It's optional and can be used to transfer empty
	string to disable STUN.
STUNServerPort	STUN server port. It will be ignored if the outboundServer is empty.
outboundServer	Outbound proxy server, for example sip.domain.com. It's optional and allows
	to transfer an empty string if not using the outbound server.
outboundServerPo	Outbound proxy server port, it will be ignored if the outboundServer is empty.
rt	

Returns

If this function succeeds, it will return value 0. If it fails, it will return a specific error code.

void com.portsip.PortSipSdk.removeUser ()

remove user account info.

int com.portsip.PortSipSdk.registerServer (int expires, int retryTimes)

Register to SIP proxy server (login to server)

Parameters

expires	Time interval for registration refreshment, in seconds. The maximum of supported value is 3600. It will be inserted into SIP REGISTER message headers.
retryTimes	The maximum of retry attempts if failed to refresh the registration. By setting to <= 0, the attempt will be disabled and onRegisterFailure callback will be
	triggered when facing retry failure.

Returns

If this function succeeds, it will return value 0. If fails, it will return a specific error code.

If the registration to server succeeds, onRegisterSuccess will be triggered; otherwise onRegisterFailure will be triggered.

int com.portsip.PortSipSdk.refreshRegistration (int expires)

Refresh the registration manually after successfully registered.

Parameters

expires	Time interval for registration refreshment, in seconds. The maximum of
	supported value is 3600. It will be inserted into SIP REGISTER message
	headers.

Returns

If this function succeeds, it will return value 0. If fails, it will return a specific error code.

If the registration to server succeeds, onRegisterSuccess will be triggered; otherwise onRegisterFailure will be triggered.

int com.portsip.PortSipSdk.unRegisterServer ()

Un-register from the SIP proxy server.

Returns

If this function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setDisplayName (String displayName)

Set the display name of user.

Parameters

displavName	That will appear in the From/To Header.
aispiay1vanic	That will appear in the From 10 freader.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Audio and video codecs functions

Functions

- int com.portsip.PortSipSdk.addAudioCodec (int enum audiocodec)
- int com.portsip.PortSipSdk.addVideoCodec (int enum videocodec)
- boolean com.portsip.PortSipSdk.isAudioCodecEmpty ()
- boolean com.portsip.PortSipSdk.isVideoCodecEmpty ()
- int com.portsip.PortSipSdk.setAudioCodecPayloadType (int enum audiocodec, int payloadType)
- int com.portsip.PortSipSdk.setVideoCodecPayloadType (int enum_videocodec, int payloadType)
- void com.portsip.PortSipSdk.clearAudioCodec ()
- void com.portsip.PortSipSdk.clearVideoCodec ()
- int com.portsip.PortSipSdk.setAudioCodecParameter (int enum_audiocodec, String sdpParameter)
- int com.portsip.PortSipSdk.setVideoCodecParameter (int enum_videocodec, String sdpParameter)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.addAudioCodec (int enum audiocodec)

Enable an audio codec, and it will be shown in SDP.

Parameters

enum_audiocodec	Audio codec type, including: ENUM_AUDIOCODEC_G729,
	ENUM AUDIOCODEC PCMA, ENUM AUDIOCODEC PCMU,
	ENUM AUDIOCODEC GSM, ENUM AUDIOCODEC G722,
	ENUM AUDIOCODEC ILBC, ENUM AUDIOCODEC AMR,
	ENUM AUDIOCODEC AMRWB, ENUM AUDIOCODEC SPEEX,
	ENUM AUDIOCODEC SPEEXWB, ENUM AUDIOCODEC ISACWB,
	ENUM AUDIOCODEC ISACSWB, ENUM AUDIOCODEC OPUS,
	ENUM AUDIOCODEC DTMF.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.addVideoCodec (int enum_videocodec)

Enable a video codec, and it will be shown in SDP.

enum videocodec	Video codec type. Supported types include ENUM VIDEOCODEC H264,
	ENUM VIDEOCODEC VP8. ENUM VIDEOCODEC VP9.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

boolean com.portsip.PortSipSdk.isAudioCodecEmpty ()

Detect if the audio codecs are enabled.

Returns

If no audio codec enabled, it will return value true; otherwise it returns false.

boolean com.portsip.PortSipSdk.isVideoCodecEmpty ()

Detect if the video codecs are enabled.

Returns

If no video codec enabled, it will return value true; otherwise it returns false.

int com.portsip.PortSipSdk.setAudioCodecPayloadType (int enum_audiocodec, int payloadType)

Set the RTP payload type for dynamic audio codec.

Parameters

enum_audiocodec	Audio codec types. Supported types include: ENUM_AUDIOCODEC_PCMU, ENUM_AUDIOCODEC_PCMA, ENUM_AUDIOCODEC_PCMU, ENUM_AUDIOCODEC_GSM, ENUM_AUDIOCODEC_G722, ENUM_AUDIOCODEC_ILBC, ENUM_AUDIOCODEC_AMR, ENUM_AUDIOCODEC_AMRWB, ENUM_AUDIOCODEC_SPEEX, ENUM_AUDIOCODEC_SPEEXWB, ENUM_AUDIOCODEC_ISACWB,
	ENUM AUDIOCODEC SPEEXWB, ENUM AUDIOCODEC ISACWB, ENUM AUDIOCODEC ISACSWB, ENUM AUDIOCODEC OPUS,
	ENUM AUDIOCODEC DTMF
payloadType	The new RTP payload type that you want to set.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoCodecPayloadType (int enum_videocodec, int payloadType)

Set the RTP payload type for dynamic video codec.

Parameters

enum_videocodec	Video codec type. Supported types include: ENUM_VIDEOCODEC_H264 ,
	ENUM_VIDEOCODEC_VP8. ENUM_VIDEOCODEC_VP9.
payloadType	The new RTP payload type that you want to set.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.clearAudioCodec ()

Remove all the enabled audio codecs.

void com.portsip.PortSipSdk.clearVideoCodec ()

Remove all the enabled video codecs.

int com.portsip.PortSipSdk.setAudioCodecParameter (int enum_audiocodec, String sdpParameter)

Set the codec parameter for audio codec.

Parameters

enum audiocodec	Audio codec type. Supported types include: ENUM AUDIOCODEC G729 ,
	ENUM AUDIOCODEC PCMA, ENUM AUDIOCODEC PCMU,
	ENUM AUDIOCODEC GSM, ENUM AUDIOCODEC G722,
	ENUM AUDIOCODEC ILBC, ENUM AUDIOCODEC AMR,
	ENUM_AUDIOCODEC_AMRWB, ENUM_AUDIOCODEC_SPEEX,
	ENUM_AUDIOCODEC_SPEEXWB, ENUM_AUDIOCODEC_ISACWB,
	ENUM_AUDIOCODEC_ISACSWB, ENUM_AUDIOCODEC_OPUS,
	ENUM AUDIOCODEC DTMF
sdpParameter	The parameter is in string format.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

See also

PortSipEnumDefine

Remarks

Example:

```
setAudioCodecParameter (AUDIOCODEC_AMR, "mode-set=0; octet-align=1;
robust-sorting=0")
```

int com.portsip.PortSipSdk.setVideoCodecParameter (int enum_videocodec, String sdpParameter)

Set the codec parameter for video codec.

Parameters

enum_videocodec	Video codec types. Supported types include: <u>ENUM_VIDEOCODEC_H264</u> ,
	ENUM_VIDEOCODEC_VP8. ENUM_VIDEOCODEC_VP9.
sdpParameter	The parameter is in string format.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

Example:

```
setVideoCodecParameter(PortSipEnumDefine.ENUM_VIDEOCODEC_H264,
"profile-level-id=420033; packetization-mode=0");
```

Detailed Description

Function Documentation

String com.portsip.PortSipSdk.getVersion ()

Get the version number of the current SDK.

Returns

String with version description

int com.portsip.PortSipSdk.enableRport (boolean enable)

Enable/Disable rport(RFC3581).

Parameters

enable enable Set to true to enable the SDK to support rport. By default it is enabled.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enableEarlyMedia (boolean enable)

Enable/disable rport(RFC3581).

enable	Set to true to enable the SDK to support rport. By default it is enabled.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code. Enable/Disable Early Media.

Parameters

enable	Set to true to enable the SDK support Early Media. By default the Early Media
	is disabled.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enableReliableProvisional (boolean enable)

Enable/Disable PRACK.

Parameters

enable	Set to true to enable the SDK support PRACK. In default the PRACK is
	disabled.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enable3GppTags (boolean enable)

Enable/disable the 3Gpp tags, including "ims.icsi.mmtel" and "g.3gpp.smsip".

Parameters

enable	Set to true to enable 3Gpp tags for SDK.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.enableCallbackSignaling (boolean enableSending, boolean enableReceived)

Enable/disable the callback of the SIP messages.

Parameters

enableSending	Set as true to enable to callback the sent SIP messages, or false to disable. Once enabled, the "onSendingSignaling" event will be triggered when the
	SDK sends a SIP message.
enableReceived	Set as true to enable to callback the received SIP messages, or false to disable. Once enabled, the "onReceivedSignaling" event will be triggered when the
	SDK receives a SIP message.

void com.portsip.PortSipSdk.setSrtpPolicy (int enum_srtppolicy)

Set the SRTP policy.

Parameters

enum srtppolicy	The SRTP policy.allow: ENUM SRTPPOLICY NONE,
,	ENUM SRTPPOLICY FORCE, ENUM SRTPPOLICY PREFER.

int com.portsip.PortSipSdk.setRtpPortRange (int minimumRtpAudioPort, int maximumRtpAudioPort, int minimumRtpVideoPort, int maximumRtpVideoPort)

This function allows to set the RTP port range for audio and video streaming.

-	W. W		
	minimumRtpAudio	The minimum RTP port for audio stream.	

Port	
maximumRtpAudio	The maximum RTP port for audio stream.
Port	
minimumRtpVideo	The minimum RTP port for video stream.
Port	-
maximumRtpVideo	The maximum RTP port for video stream.
Port	-

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

The port range ((max - min) % maxCallLines) should be greater than 4.

int com.portsip.PortSipSdk.setRtcpPortRange (int minimumRtcpAudioPort, int maximumRtcpAudioPort, int minimumRtcpVideoPort, int maximumRtcpVideoPort)

This function allows to set the RTCP port range for audio and video streaming.

Parameters

minimumRtcpAudi	The minimum RTCP port for audio stream.
oPort	
maximumRtcpAudi oPort	The maximum RTCP port for audio stream.
minimumRtcpVide oPort	The minimum RTCP port for video stream.
maximumRtcpVide	The maximum RTCP port for video stream.
oPort	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

The port range ((max - min) % maxCallLines) should be greater than 4.

int com.portsip.PortSipSdk.enableCallForward (boolean forBusyOnly, String forwardTo)

Enable call forwarding.

Parameters

forBusyOnly	If this parameter is set to true, the SDK will forward incoming calls when the
	user is currently busy. If set it to false, SDK will forward all incoming calls.
forwardTo	The target to which the call will be forwarded. It must be in the format of
	sip: <u>xxxx@sip.portsip.com</u> .

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.disableCallForward ()

Disable the call forwarding. The SDK will not forward any incoming call when this function is called.

Returns

If the function succeeds, it will not return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enableSessionTimer (int timerSeconds)

This function allows to periodically refresh Session Initiation Protocol (SIP) sessions by sending repeated INVITE requests.

Parameters

timerSeconds	The value of the refresh interval in seconds. A minimum of 90 seconds
	required.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

The repeated INVITE requests, or re-INVITEs, are sent during an active call log to allow user agents (UA) or proxies to determine the status of a SIP session. Without this keep-alive mechanism, proxies that remember incoming and outgoing requests (stateful proxies) may continue to retain call state in vain. If a UA fails to send a BYE message at the end of a session, or if the BYE message is lost due to network problems, a stateful proxy will not know that the session has ended. The re-INVITES ensure that active sessions stay active and completed sessions are terminated.

void com.portsip.PortSipSdk.disableSessionTimer ()

Disable the session timer.

void com.portsip.PortSipSdk.setDoNotDisturb (boolean state)

Enable/disable the "Do not disturb" status.

Parameters

state	If it is set to true, the SDK will reject all incoming calls.

void com.portsip.PortSipSdk.enableAutoCheckMwi (boolean state)

Enable/disable the "Auto Check MWI" status.

Parameters

state	If it is set to true, the SDK will check Mwi automatically.

int com.portsip.PortSipSdk.setRtpKeepAlive (boolean state, int keepAlivePayloadType, int deltaTransmitTimeMS)

Enable or disable to send RTP keep-alive packet when the call is ongoing.

Parameters

state	When it's set to true, it's allowed to send the keep-alive packet during the	
	conversation;	
keepAlivePayload	The payload type of the keep-alive RTP packet. It's usually set to 126.	
Type		
deltaTransmitTime	The interval for sending keep-alive RTP packet, in millisecond. Recommended	
MS	value ranges 15000 - 300000.	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setKeepAliveTime (int keepAliveTime)

Enable or disable to send SIP keep-alive packet.

keepAliveTime	This is the tin	ne interval for SIP keep-alive	, in seconds. When it is set to 0, the
---------------	-----------------	--------------------------------	--

		SIP keep-alive will be disabled. Recommended value is 30 or 50.
--	--	---

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setAudioSamples (int ptime, int maxptime)

Set the audio capture sample, which will be present in the SDP of INVITE and 200 OK message as "ptime and "maxptime" attribute.

Parameters

ptime	It should be a multiple of 10 between 10 - 60 (included 10 and 60).	
maxptime	The "maxptime" attribute should be a multiple of 10 between 10 - 60 (included	
	10 and 60). It can't be less than "ptime".	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.addSupportedMimeType (String methodName, String mimeType, String subMimeType)

Set the SDK to receive SIP messages that include special mime type.

Parameters

methodName	Method name of the SIP message, such as INVITE, OPTION, INFO,	
	MESSAGE, UPDATE, ACK etc. For more details please refer to RFC3261.	
mimeType	The mime type of SIP message.	
subMimeType	The sub mime type of SIP message.	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code

Remarks

In default, PortSIP VoIP SDK supports media types (mime types) included in the below incoming SIP messages:

```
"message/sipfrag" in NOTIFY message.
    "application/simple-message-summary" in NOTIFY message.
    "text/plain" in MESSAGE message. "application/dtmf-relay" in INFO
    message. <br/>    "application/media_control+xml" in INFO message.
```

The SDK allows to receive SIP messages that include above mime types. Now if remote side send an INFO SIP message with its "Content-Type" header value "text/plain", SDK will reject this INFO message, because "text/plain" of INFO message is not included in the default type list. How should we enable the SDK to receive SIP INFO messages that include "text/plain" mime type? The answer is addSupportedMimyType:

```
addSupportedMimeType ("INFO", "text", "plain");
```

If the user wishes to receive the NOTIFY message with "application/media_control+xml", it should be set as below:

```
addSupportedMimeType ("NOTIFY", "application", "media_control+xml");
For more details about the mime type, please visit:
http://www.iana.org/assignments/media-types/
```

Access SIP message header functions

Functions

- String com.portsip.PortSipSdk.getSipMessageHeaderValue (String sipMessage, String headerName)
- long <u>com.portsip.PortSipSdk.addSipMessageHeader</u> (long sessionId, String methodName, int msgType, String headerName, String headerValue)
- int com.portsip.PortSipSdk.removeAddedSipMessageHeader (long addedSipMessageId)
- void com.portsip.PortSipSdk.clearAddedSipMessageHeaders ()
- long <u>com.portsip.PortSipSdk.modifySipMessageHeader</u> (long sessionId, String methodName, int msgType, String headerName, String headerValue)
- int com.portsip.PortSipSdk.removeModifiedSipMessageHeader (long modifiedSipMessageId)
- void <u>com.portsip.PortSipSdk.clearModifiedSipMessageHeaders</u> ()

Detailed Description

Function Documentation

String com.portsip.PortSipSdk.getSipMessageHeaderValue (String sipMessage, String headerName)

Access the SIP header of SIP message.

Parameters

sipMessage	The SIP message.
headerName	The header of which user wishes to access the SIP message.

Returns

String. The SIP header of SIP message.

long com.portsip.PortSipSdk.addSipMessageHeader (long sessionId, String methodName, int msgType, String headerName, String headerValue)

Add the SIP Message header into the specified outgoing SIP message.

Parameters

sessionId	Add the header to the SIP message with the specified session Id only. By	
	setting to -1, it will be added to all messages.	
methodName	Add the header to the SIP message with specified method name only. For	
	example: "INVITE", "REGISTER", "INFO" etc. If "ALL" specified, it will	
	add all SIP messages.	
msgType	1 refers to apply to the request message, 2 refers to apply to the response	
	message, 3 refers to apply to both request and response.	
headerName	The header name which will appear in SIP message.	
headerValue	The custom header value.	

Returns

If the function succeeds, it will return the addedSipMessageId, which is greater than 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.removeAddedSipMessageHeader (long addedSipMessageId)

Remove the headers (custom header) added by addSipMessageHeader.

Parameters

addedSipMessageI	The addedSipMessageId return by addSipMessageHeader.
d	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.clearAddedSipMessageHeaders ()

Clear the added extension headers (custom headers)

Remarks

For example, we have added two custom headers into every outgoing SIP message and want to have them removed.

```
addSipMessageHeader (-1,"ALL",3,"Blling", "usd100.00");
    addSipMessageHeader (-1,"ALL",3,"ServiceId", "8873456");
    clearAddedSipMessageHeaders();
```

If this function is called, the added extension headers will no longer appear in outgoing SIP message.

long com.portsip.PortSipSdk.modifySipMessageHeader (long sessionId, String methodName, int msgType, String headerName, String headerValue)

Modify the special SIP header value for every outgoing SIP message.

Parameters

sessionId	The header to the SIP message with the specified session Id. By setting to -1, it will be added to all messages.
methodName	Modify the header to the SIP message with specified method name only. For example: "INVITE", "REGISTER", "INFO" etc. If "ALL" specified, it will add all SIP messages.
msgType	1 refers to apply to the request message, 2 refers to apply to the response message, 3 refers to apply to both request and response.
headerName	The SIP header name of which the value will be modified.
headerValue	The heaver value to be modified.

Returns

If the function succeeds, it will return modifiedSipMessageId, which is greater than 0. If the function fails, it will return a specific error code.

Remarks

Example: modify "Expires" header and "User-Agent" header value for every outgoing SIP message:

```
modifySipMessageHeader (-1, "ALL", 3, "Expires", "1000");
modifySipMessageHeader (-1, "ALL", 3, "User-Agent", "MyTest Softphone 1.0");
```

int com.portsip.PortSipSdk.removeModifiedSipMessageHeader (long modifiedSipMessageId)

Remove the headers (custom header) added by modifiedSipMessageId.

modifiedSipMessa	The modifiedSipMessageId return by modifySipMessageHeader.
geld	

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.clearModifiedSipMessageHeaders ()

Clear the modify headers value. Once cleared, it will no longer modify every outgoing SIP message header values.

Remarks

Example: modify two headers value for every outgoing SIP message and then clear it:

```
modifySipMessageHeader (-1,"ALL",3, "Expires", "1000");
modifySipMessageHeader (-1,"ALL",3, "User-Agent", "MyTest Softphone 1.0");
cleaModifyHeaders();
```

Audio and video functions

Functions

- int com.portsip.PortSipSdk.setVideoDeviceId (int deviceId)
- int <u>com.portsip.PortSipSdk.enableVideoHardwareCodec</u> (boolean enableHWEncoder, boolean enableHWDecoder)
- int <u>com.portsip.PortSipSdk.setVideoResolution</u> (int width, int height)
- int com.portsip.PortSipSdk.setVideoCropAndScale (boolean enable)
- int com.portsip.PortSipSdk.setAudioBitrate (long sessionId, int enum audiocodec, int bitrateKbps)
- int com.portsip.PortSipSdk.setVideoBitrate (long sessionId, int bitrateKbps)
- int <u>com.portsip.PortSipSdk.setVideoFrameRate</u> (long sessionId, int frameRate)
- int com.portsip.PortSipSdk.sendVideo (long sessionId, boolean send)

- int com.portsip.PortSipSdk.setRemoteVideoWindow (long sessionId, PortSIPVideoRenderer renderer)
- void com.portsip.PortSipSdk.displayLocalVideo (boolean state, boolean mirror)
- int com.portsip.PortSipSdk.setVideoNackStatus (boolean state)
- int com.portsip.PortSipSdk.setChannelOutputVolumeScaling (long sessionId, int scaling)
- int com.portsip.PortSipSdk.setChannelInputVolumeScaling (long sessionId, int scaling)
- Set< PortSipEnumDefine.AudioDevice > <u>com.portSipSdk.getAudioDevices</u> ()
- int com.portsip.PortSipSdk.setAudioDevice (PortSipEnumDefine.AudioDevice defaultDevice)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.setVideoDeviceId (int deviceId)

Set the video device that will be used for video call.

Parameters

deviceId	Device ID (index) for video device (camera).

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enableVideoHardwareCodec (boolean enableHWEncoder, boolean enableHWDecoder)

Set enable/disable video Hardware codec.

Parameters

	If it is set to true, the SDK will use video hardware encoder when available. By default it is true.	
enableHWDecoder If it is set to true, the SDK will use video hardware decoder when ava		
	By default it is true.	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoResolution (int width, int height)

Set the video capturing resolution.

Parameters

width	Video resolution, width
height	Video resolution, height

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoCropAndScale (boolean enable)

When the camera does not support specified resolution, enable or disable SDK to crop and scale to the specified resolution.

Parameters

enable	Enable or disable to crop or scale the video to fit in specified resolution. By
	default it is disabled.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setAudioBitrate (long sessionId, int enum_audiocodec, int bitrateKbps)

Set the audio bitrate.

Parameters

sessionId	The session ID of the call.
enum audiocodec	Audio codec type allowed: ENUM AUDIOCODEC OPUS
bitrateKbps	The Audio bitrate in KBPS.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoBitrate (long sessionId, int bitrateKbps)

Set the video bitrate.

sessionId	The session ID of the call.	
hitrateKhns	The video bitrate in KBPS.	

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoFrameRate (long sessionId, int frameRate)

Set the video frame rate. Usually you do not need to call this function to set the frame rate since the SDK uses default frame rate.

Parameters

sessionId	The session ID of the call.
frameRate	The frame rate value, with its minimum of 5, and maximum value of 30. The
	greater the value is, the better video quality enabled and more bandwidth
	required;

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.sendVideo (long sessionId, boolean send)

Send the video to remote side.

Parameters

sessionId	The session ID of the call.
send	Set to true to send the video, or false to stop sending.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.setLocalVideoWindow (PortSIPVideoRenderer renderer)

Set the window that is used for displaying the local video image.

Parameters

rondoror	SurfaceView a SurfaceView for displaying local video image from camera.
Tenacrer	diffuee view a surface view for displaying local video image from camera.

int com.portsip.PortSipSdk.setRemoteVideoWindow (long sessionId, PortSIPVideoRenderer renderer)

Set the window for a session that is used for displaying the received remote video image.

Parameters

sessionId	The session ID of the call.	
renderer	SurfaceView a SurfaceView for displaying the received remote video image.	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.displayLocalVideo (boolean state, boolean mirror)

Start/stop displaying the local video image.

Parameters

state	Set to true to display local video image.
mirror	Set to true to display the mirror image of local video.

int com.portsip.PortSipSdk.setVideoNackStatus (boolean state)

Enable/disable the NACK feature (rfc6642) which helps to improve the video quality.

Parameters

state	Set to true to enable.	
-------	------------------------	--

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setChannelOutputVolumeScaling (long sessionId, int scaling)

Set a volume |scaling| to be applied to the outgoing signal of a specific audio channel.

Parameters

sessionId	The session ID of the call.
scaling	Valid scale ranges [0, 1000]. Default is 100.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setChannelInputVolumeScaling (long sessionId, int scaling)

Set a volume |scaling| to be applied to the microphone signal of a specific audio channel.

Parameters

sessionId	The session ID of the call.
scaling	Valid scale ranges [0, 1000]. Default is 100.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Set<PortSipEnumDefine.AudioDevice> com.portsip.PortSipSdk.getAudioDevices ()

Get current set of available/selectable audio devices.

Returns

Current set of available/selectable audio devices.

int com.portsip.PortSipSdk.setAudioDevice (PortSipEnumDefine.AudioDevice defaultDevice)

Set the audio device that will used for audio call. For Android and iOS, switch between earphone and Loudspeaker allowed.

Parameters

defaultDevice	Set to true the SDK use loudspeaker for audio call, this just available for
	mobile platform only.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Call functions

Functions

- long com.portsip.PortSipSdk.call (String callee, boolean sendSdp, boolean videoCall)
- int com.portsip.PortSipSdk.rejectCall (long sessionId, int code)

- int com.portsip.PortSipSdk.hangUp (long sessionId)
- int com.portsip.PortSipSdk.answerCall (long sessionId, boolean videoCall)
- int com.portsip.PortSipSdk.updateCall (long sessionId, boolean enableAudio, boolean enableVideo)
- int <u>com.portsip.PortSipSdk.hold</u> (long sessionId)
- int com.portsip.PortSipSdk.unHold (long sessionId)
- int com.portsip.PortSipSdk.muteSession (long sessionId, boolean muteIncomingAudio, boolean muteOutgoingAudio, boolean muteIncomingVideo, boolean muteOutgoingVideo)
- int com.portsip.PortSipSdk.forwardCall (long sessionId, String forwardTo)
- long com.portsip.PortSipSdk.pickupBLFCall (String replaceDialogId, boolean videoCall)
- int com.portsip.PortSipSdk.sendDtmf (long sessionId, int enum_dtmfMethod, int code, int dtmfDuration, boolean playDtmfTone)

Detailed Description

Function Documentation

long com.portsip.PortSipSdk.call (String callee, boolean sendSdp, boolean videoCall)

Make a call

Parameters

callee	The callee. It can be a name only or full SIP URI, for example: user001 or
	sip: <u>user001@sip.iptel.org</u> or sip: <u>user002@sip.yourdomain.com</u> :5068
sendSdp	If it is set to false, the outgoing call will not include the SDP in INVITE
	message.
videoCall	If it is set to true and at least one video codec was added, the outgoing call will include the video codec into SDP. Otherwise no video codec will be added into outgoing SDP.

Returns

If the function succeeds, it will return the session ID of the call, which is greater than 0. If the function fails, it will return a specific error code.

Note: the function success just means the outgoing call is processing, you need to detect the call final state in onInviteTrying, onInviteRinging, onInviteFailure callback events.

int com.portsip.PortSipSdk.rejectCall (long sessionId, int code)

rejectCall Reject the incoming call.

Parameters

sessionId	The session ID of the call.
code	Reject code, for example, 486, 480 etc.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.hangUp (long sessionId)

hangUp Hang up the call.

sessionId	Session ID of the call.

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.answerCall (long sessionId, boolean videoCall)

answerCall Answer the incoming call.

Parameters

sessionId	The session ID of call.
videoCall	If the incoming call is a video call and the video codec is matched, set to true
	to answer the video call.
	If set to false, the answer call does not include video codec answer anyway.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.updateCall (long sessionId, boolean enableAudio, boolean enableVideo)

updateCall Use the re-INVITE to update the established call.

Parameters

sessionId	The session ID of call.
enableAudio	Set to true to allow the audio in updated call, or false to disable audio in
	updated call.
enableVideo	Set to true to allow the video in update call, or false to disable video in updated
	call.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return specific error code.

Remarks

Example usage:

Example 1: A called B with the audio only, and B answered A, there would be an audio conversation between A and B. Now A want to see B through video, A could use these functions to fulfill it.

```
clearVideoCodec();
addVideoCodec(VIDEOCODEC_H264);
updateCall(sessionId, true, true);
```

Example 2: Remove video stream from the current conversation.

```
updateCall(sessionId, true, false);
```

int com.portsip.PortSipSdk.hold (long sessionId)

To place a call on hold.

Parameters

sessionId The session ID of call.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.unHold (long sessionId)

Take off hold.

Parameters

sessionId	The session ID of call.	
-----------	-------------------------	--

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.muteSession (long sessionId, boolean muteIncomingAudio, boolean muteOutgoingAudio, boolean muteIncomingVideo, boolean muteOutgoingVideo)

Mute the specified audio or video session.

Parameters

sessionId	The session ID of the call.
muteIncomingAudi	Set it to true to mute incoming audio stream. Once set, remote side audio
0	cannot be heard.
muteOutgoingAudi	Set it to true to mute outgoing audio stream. Once set, the remote side cannot
0	hear the audio.
muteIncomingVide	Set it to true to mute incoming video stream. Once set, remote side video
0	cannot be seen.
muteOutgoingVide	Set it to true to mute outgoing video stream, the remote side cannot see the
0	video.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.forwardCall (long sessionId, String forwardTo)

Forward call to another one when receiving the incoming call.

Parameters

sessionId	The session ID of the call.
forwardTo	Target of the forward. It can be either "sip:number@sipserver.com" or
	"number".

Returns

If the function succeeds, it will return value 0. If the function fails, it will return value a specific error code.

long com.portsip.PortSipSdk.pickupBLFCall (String replaceDialogId, boolean videoCall)

This function will be used for picking up a call based on the BLF (Busy Lamp Field) status.

Parameters

replaceDialogId	The ID of the call which will be pickup. It comes with onDialogStateUpdated
	callback.
videoCall	Indicates pickup video call or audio call

Returns

If the function succeeds, it will return a session ID that is greater than 0 to the new call, otherwise returns a specific error code that is less than 0.

Remarks

The scenario is:

 User 101 subscribed the user 100's call status: sendSubscription(mSipLib, "100", "dialog"); 2. When 100 holds a call or 100 is ringing, onDialogStateUpdated callback will be triggered, and 101 will receive this callback. Now 101 can use pickupBLFCall function to pick the call rather than 100 to talk with caller.

int com.portsip.PortSipSdk.sendDtmf (long sessionId, int enum_dtmfMethod, int code, int dtmfDuration, boolean playDtmfTone)

Send DTMF tone.

Parameters

sessionId	The session ID of the call.
enum dtmfMethod	DTMF tone could be sent via two methods: DTMF_RFC2833 or
	DTMF_INFO. The DTMF_RFC2833 is recommend.
code	The DTMF tone. Values include:

Couc	THE E THE CORE. YOUNG HISTORY.
code	Description
0	The DTMF tone 0.
1	The DTMF tone 1.
2	The DTMF tone 2.
3	The DTMF tone 3.
4	The DTMF tone 4.
5	The DTMF tone 5.
6	The DTMF tone 6.
7	The DTMF tone 7.
8	The DTMF tone 8.
9	The DTMF tone 9.
10	The DTMF tone *.
11	The DTMF tone #.
12	The DTMF tone A.
13	The DTMF tone B.
14	The DTMF tone C.
15	The DTMF tone D.
16	The DTMF tone FLASH.

Parameters

dtmfDuration	The DTMF tone samples. Recommended value 160.
playDtmfTone	Set to true the SDK play local DTMF tone sound during send DTMF.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Refer functions

Functions

- int com.portsip.PortSipSdk.refer (long sessionId, String referTo)
- int com.portsip.PortSipSdk.attendedRefer (long sessionId, long replaceSessionId, String referTo)
- int com.portsip.PortSipSdk.attendedRefer2 (long sessionId, long replaceSessionId, String replaceMethod, String target, String referTo)
- int com.portsip.PortSipSdk.outOfDialogRefer (long replaceSessionId, String replaceMethod, String target, String referTo)
- long com.portsip.PortSipSdk.acceptRefer (long referId, String referSignaling)
- int com.portsip.PortSipSdk.rejectRefer (long referId)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.refer (long sessionId, String referTo)

Transfer the current call to another callee.

Parameters

sessionId	The session ID of the call.
referTo	Target callee of the transfer. It can be either "sip:number@sipserver.com" or
	"number".

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

refer (sessionId, "sip:testuser12@sip.portsip.com");

You can refer to the video on Youtube at:

<u>https://www.youtube.com/watch?v=_2w9EGgr3FY</u>, which will demonstrate how to complete the transfer.

int com.portsip.PortSipSdk.attendedRefer (long sessionId, long replaceSessionId, String referTo)

Make an attended refer.

Parameters

sessionId	The session ID of the call.
replaceSessionId	Session ID of the replace call.
referTo	Target callee of the refer. It can be either "sip:number@sipserver.com" or "number".

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

Please read the sample project source code to get more details, or you can refer to the video on YouTube at:

https://www.youtube.com/watch?v=_2w9EGgr3FY

Note: Please use Windows Media Player to play the AVI file, which demonstrates how to complete the transfer.

int com.portsip.PortSipSdk.attendedRefer2 (long sessionId, long replaceSessionId, String replaceMethod, String target, String referTo)

Make an attended refer.

sessionId	The session ID of the call.
replaceSessionId	The session ID of the session to be replaced.
replaceMethod	The SIP method name to be added in the "Refer-To" header, usually INVITE
	or BYE.
target	The target to which the REFER message will be sent.

uafauTa	The LIDI to be added into the "Defer To" beader
referTo	The URI to be added into the "Refer-To" header.

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.outOfDialogRefer (long replaceSessionId, String replaceMethod, String target, String referTo)

Make an attended refer.

Parameters

replaceSessionId	The session ID of the session which will be replaced.
replaceMethod	The SIP method name which will be added in the "Refer-To" header, usually
	INVITE or BYE.
target	The target to which the REFER message will be sent.
referTo	The URI which will be added into the "Refer-To" header.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

long com.portsip.PortSipSdk.acceptRefer (long referId, String referSignaling)

By accepting the REFER request, a new call will be made if this function is called. The function is usually called after onReceivedRefer callback event.

Parameters

referId	The ID of REFER request that comes from onReceivedRefer callback event.
referSignaling	The SIP message of REFER request that comes from onReceivedRefer
	callback event.

Returns

If the function succeeds, it will return a session ID greater than 0 to the new call for REFER; otherwise it will return a specific error code less than 0;

int com.portsip.PortSipSdk.rejectRefer (long referId)

Reject the REFER request.

Parameters

referId	The ID of REFER request that comes from onReceivedRefer callback event.
rejeria	The 1D of REF ER request that comes from ourceer vearcier canonex event.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Send audio and video stream functions

Functions

- int com.portsip.PortSipSdk.enableSendPcmStreamToRemote (long sessionId, boolean state, int streamSamplesPerSec)
- int com.portsip.PortSipSdk.sendPcmStreamToRemote (long sessionId, byte[] data, int dataLength)
- int com.portsip.PortSipSdk.enableSendVideoStreamToRemote (long sessionId, boolean state)
- int com.portsip.PortSipSdk.sendVideoStreamToRemote (long sessionId, byte[] data, int dataLength, int width, int height)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.enableSendPcmStreamToRemote (long sessionId, boolean state, int streamSamplesPerSec)

Enable the SDK send PCM stream data to remote side from another source instead of microphone. This function MUST be called first to send the PCM stream data to another side.

Parameters

sessionId	The session ID of call.
state	Set to true to enable the send stream, or false to disable.
streamSamplesPer	The PCM stream data sample, in seconds. For example 8000 or 16000.
Sec	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.sendPcmStreamToRemote (long sessionId, byte[] data, int dataLength)

Send the audio stream in PCM format from another source instead of audio device capturing (microphone).

Parameters

sessionId	Session ID of the call conversation.
data	The PCM audio stream data. It must be 16bit, mono.
dataLength	The size of data.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

Usually we should use it like below:

```
enableSendPcmStreamToRemote(sessionId, true, 16000);
    sendPcmStreamToRemote(sessionId, data, dataSize);
```

You can't have too much audio data at one time as we have 100ms audio buffer only. Once you put too much, data will be lost. It is recommended to send 20ms audio data every 20ms.

int com.portsip.PortSipSdk.enableSendVideoStreamToRemote (long sessionId, boolean state)

Enable the SDK to send video stream data to remote side from another source instead of camera.

This function MUST be called first to send the video stream data to another side.

Parameters

sessionId	The session ID of call.
state	Set to true to enable the send stream, or false to disable.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.sendVideoStreamToRemote (long sessionId, byte[] data, int dataLength, int width, int height)

Send the video stream in i420 from another source instead of video device capturing (camera).

Before calling this function, you MUST call the enableSendVideoStreamToRemote function.

Parameters

sessionId	Session ID of the call conversation.
data	The video stream data. It must be in i420 format.
dataLength	The size of data.
width	The width of the video image.
height	The height of video image.

Returns

If the function succeeds, it will return value is 0. If the function fails, it will return a specific error code.

RTP packets, Audio stream and video stream callback

functions

Functions

- void <u>com.portsip.PortSipSdk.setRtpCallback</u> (boolean enable)
- void com.portsip.PortSipSdk.enableAudioStreamCallback (long sessionId, boolean enable, int enum audioCallbackMode)
- void <u>com.portsip.PortSipSdk.enableVideoStreamCallback</u> (long sessionId, int enum videoCallbackMode)

Detailed Description

functions

Function Documentation

void com.portsip.PortSipSdk.setRtpCallback (boolean enable)

Set the RTP callbacks to allow access to the sent and received RTP packets.

Parameters

•	aramotoro	
	enable	Set to true to enable the RTP callback for receiving and sending RTP packets.
		The onSendingRtpPacket and onReceivedRtpPacket events will be triggered.

void com.portsip.PortSipSdk.enableAudioStreamCallback (long sessionId, boolean enable, int enum audioCallbackMode)

Enable/disable the audio stream callback. The onAudioRawCallback event will be triggered if the callback is enabled.

sessionId	The session ID of call.
enable	Set to true to enable audio stream callback, or false to stop the callback.

enum audioCallba	The audio stream callback mode. Supported modes include
ckMode	ENUM_AUDIOSTREAM_NONE,
	ENUM AUDIOSTREAM LOCAL PER CHANNEL,
	ENUM AUDIOSTREAM REMOTE PER CHANNEL
	ENUM AUDIOSTREAM BOTH PER CHANNEL.

void com.portsip.PortSipSdk.enableVideoStreamCallback (long sessionId, int enum videoCallbackMode)

Enable/disable the video stream callback, the onVideoRawCallback event will be triggered if the callback is enabled.

Parameters

sessionId	The session ID of call.
enum_videoCallba	The video stream callback mode. Supported modes include
ckMode	ENUM VIDEOSTREAM NONE, ENUM VIDEOSTREAM LOCAL,
	ENUM VIDEOSTREAM REMOTE, ENUM VIDEOSTREAM BOTH.

Record functions

Functions

- int com.portsip.PortSipSdk.startRecord (long sessionId, String recordFilePath, String recordFileName, boolean appendTimeStamp, int enum_audioFileFormat, int enum_audioRecordMode, int enum_videocodec, int enum_videoRecordMode)
- int com.portsip.PortSipSdk.stopRecord (long sessionId)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.startRecord (long sessionId, String recordFilePath, String recordFileName, boolean appendTimeStamp, int enum_audioFileFormat, int enum audioRecordMode, int enum videocodec, int enum videoRecordMode)

Start recording the call.

sessionId	The session ID of call conversation.
recordFilePath	The file path to save record file. It must be existent.
recordFileName	The file name of record file. For example audiorecord.wav or videorecord.avi.
appendTimeStamp	Set to true to append the timestamp to the name of the recording file.
enum_audioFileFo	The audio record file format, allow below values:
rmat	FILEFORMAT_WAVE = 1, ///< The record audio file is WAVE format.
	FILEFORMAT_AMR, ///< The record audio file is in AMR format with all
	voice data compressed by AMR codec.
enum_audioRecor	The audio record mode, allow below values:
dMode	$RECORD_NONE = 0$, ///< Not Record.
	RECORD_RECV = 1, ///< Only record the received data.
	RECORD_SEND, ///< Only record send data.
	RECORD_BOTH ///< The record audio file is WAVE format.
enum videocodec	The codec used for compressing the video data to save into video record file.
enum videoRecord	Allow to set video record mode. Support to record received and/or sent video.

l	
⊥ Moae	
1,1000	

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.stopRecord (long sessionId)

Stop recording.

Parameters

sessionId	The session ID of call conversation.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Play audio and video file to remote functions

Functions

- int com.portsip.PortSipSdk.playVideoFileToRemote (long sessionId, String aviFile, boolean loop, boolean playAudio)
- int com.portsip.PortSipSdk.stopPlayVideoFileToRemote (long sessionId)
- int com.portsip.PortSipSdk.playAudioFileToRemote (long sessionId, String filename, int fileSamplesPerSec, boolean loop)
- int com.portsip.PortSipSdk.stopPlayAudioFileToRemote (long sessionId)
- int com.portsip.PortSipSdk.playAudioFileToRemoteAsBackground (long sessionId, String filename, int fileSamplesPerSec)
- int com.portsip.PortSipSdk.stopPlayAudioFileToRemoteAsBackground (long sessionId)
- void com.portsip.PortSipSdk.audioPlayLoopbackTest (boolean enable)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.playVideoFileToRemote (long sessionId, String aviFile, boolean loop, boolean playAudio)

Play an AVI file to remote party.

Parameters

sessionId	Session ID of the call.
aviFile	The full filepath, such as "/mnt/sdcard/test.avi".
loop	Set to false to stop playing video file when it is ended, or true to play it repeatedly.
playAudio	If set to true, audio and video will be played together; or false to play the video only.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.stopPlayVideoFileToRemote (long sessionId)

Stop play video file to remote side.

Parameters

sessionId	Session ID of the call.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.playAudioFileToRemote (long sessionId, String filename, int fileSamplesPerSec, boolean loop)

Play a wave file to remote party.

Parameters

sessionId	Session ID of the call.
filename	The full filepath, such as "/mnt/sdcard/test.wav".
fileSamplesPerSec	The wave file sample in seconds. It could be 8000, 16000 or 32000.
loop	Set to false to stop playing audio file when it is ended, or true to play it
	repeatedly.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.stopPlayAudioFileToRemote (long sessionId)

Stop playing wave file to remote side.

Parameters

sessionId	Session ID of the call.
-----------	-------------------------

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.playAudioFileToRemoteAsBackground (long sessionId, String filename, int fileSamplesPerSec)

Play a wave file to remote party as conversation background sound.

Parameters

sessionId	Session ID of the call.
filename	The full filepath, such as "/mnt/sdcard/test.wav".
fileSamplesPerSec	The wave file sample, in seconds. It should be 8000, 16000 or 32000.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.stopPlayAudioFileToRemoteAsBackground (long sessionId)

Stop playing a wave file to remote party as background sound for the conversation.

Parameters

sessionId	Session ID of the call.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.audioPlayLoopbackTest (boolean enable)

Used for testing loopback for the audio device.

Parameters

enable	Set to true to start testing audio loopback test; or set to false to stop.	
--------	--	--

Conference functions

Functions

- int com.portsip.PortSipSdk.createAudioConference ()
- int conference (PortSIPVideoRenderer conferenceVideoWindow, int videoWidth, int videoHeight, boolean displayLocalVideoInConference)
- void com.portsip.PortSipSdk.destroyConference ()
- int <u>com.portsip.PortSipSdk.setConferenceVideoWindow</u> (<u>PortSIPVideoRenderer</u> conferenceVideoWindow)
- int com.portsip.PortSipSdk.joinToConference (long sessionId)
- int com.portsip.PortSipSdk.removeFromConference (long sessionId)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.createAudioConference ()

Create an audio conference. It will fail if the existing conference is not ended yet.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.createVideoConference (<u>PortSIPVideoRenderer</u> conferenceVideoWindow, int videoWidth, int videoHeight, boolean displayLocalVideoInConference)

Create a video conference. It will fail if the existing conference is not ended yet.

Parameters

conferenceVideoW	<u>SurfaceView</u> The window used for displaying the conference video.
indow	
videoWidth	Width of conference video resolution
videoHeight	Height of conference video resolution
displayLocalVideo	Display local video during conference
InConference	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

void com.portsip.PortSipSdk.destroyConference ()

End the exist conference.

int com.portsip.PortSipSdk.setConferenceVideoWindow (<u>PortSIPVideoRenderer</u> conferenceVideoWindow)

Set the window for a conference that is used for displaying the received remote video image.

Parameters

conferenceVideoW	SurfaceView The window which is used for displaying the conference video
indow	

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.joinToConference (long sessionId)

Join a session into existing conference. If the call is in hold, it will be un-hold automatically.

Parameters

S	essionId	Session ID of the call.
---	----------	-------------------------

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.removeFromConference (long sessionId)

Remove a session from an existing conference.

Parameters

sessionId Session ID of the call.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

RTP and RTCP QOS functions

Functions

- int com.portsip.PortSipSdk.setAudioRtcpBandwidth (long sessionId, int BitsRR, int BitsRS, int KBitsAS)
- int <u>com.portsip.PortSipSdk.setVideoRtcpBandwidth</u> (long sessionId, int BitsRR, int BitsRS, int KBitsAS)
- int com.portsip.PortSipSdk.enableAudioQos (boolean state)
- int com.portsip.PortSipSdk.enableVideoQos (boolean state)
- int com.portsip.PortSipSdk.setVideoMTU (int mtu)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.setAudioRtcpBandwidth (long sessionId, int BitsRR, int BitsRS, int KBitsAS)

Set the audio RTCP bandwidth parameters as RFC3556.

Parameters

sessionId	Set the audio RTCP bandwidth parameters as RFC3556.
BitsRR	The bits for the RR parameter.
BitsRS	The bits for the RS parameter.
KBitsAS	The Kbits for the AS parameter.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoRtcpBandwidth (long sessionId, int BitsRR, int BitsRS, int KBitsAS)

Set the video RTCP bandwidth parameters as the RFC3556.

Parameters

sessionId	The session ID of call conversation.
BitsRR	The bits for the RR parameter.
BitsRS	The bits for the RS parameter.
KBitsAS	The Kbits for the AS parameter.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enableAudioQos (boolean state)

Set the DSCP (differentiated services code point) value of QoS (Quality of Service) for audio channel.

Parameters

state	Set to YES to enable audio QoS and DSCP value will be 46; or NO to disable
	audio QoS and DSCP value will be 0.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.enableVideoQos (boolean state)

Set the DSCP(differentiated services code point) value of QoS(Quality of Service) for video channel.

Parameters

state	Set to YES to enable video QoS and DSCP value will be 34; or NO to disable
	video QoS and DSCP value will be 0.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setVideoMTU (int mtu)

Set the MTU size for video RTP packet.

Parameters

mtu	Set MTU value. Allow values range 512 - 65507. Default is 14000.

Returns

If the function succeeds, the return value is 0. If the function fails, the return value is a specific error code.

RTP statistics functions

Functions

- $\begin{array}{l} int \ \underline{com.portsip.PortSipSdk.getAudioStatistics} \ (long \ sessionId, \ int[] \ statistics) \\ int \ \underline{com.portsip.PortSipSdk.getVideoStatistics} \ (long \ sessionId, \ int[] \ statistics) \\ \end{array}$

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.getAudioStatistics (long sessionId, int[] statistics)

Obtain the statistics of audio channel.

Parameters

sessionId	The session ID of call conversation.
statistics	Return audio statistics
	statistics[0] - The number of sent bytes.
	statistics[1] - The number of sent packets.
	statistics[2] - The number of sent but lost packet.
	statistics[3] - Fraction of sent but lost packet in percentage.
	statistics[4] - The round-trip time of the session, in milliseconds.
	statistics[5] - Sent Audio codec type.
	statistics[6] - The sent jitter, in milliseconds.
	statistics[7] - The sent audio level. It ranges 0 - 9.
	statistics[8] - The number of received bytes.
	statistics[9] - The number of received packets.
	statistics[10] - The number of received but lost packets.
	statistics[11] - Fraction of received but lost packet in percentage.
	statistics[12] - Received Audio codec type.
	statistics[13] - The received jitter, in milliseconds.
	statistics[14] - The received audio level. It ranges 0 - 9.

Returns

If the function succeeds, it will return value is 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.getVideoStatistics (long sessionId, int[] statistics)

Obtain the statistics of video channel.

sessionId	The session ID of call conversation.
statistics	Return Video statistics
	statistics[0] - The number of sent bytes.

statistics[1] - The number of sent packets. statistics[2] - The number of sent but lost packet. statistics[3] - Fraction of sent lost in percentage. statistics[4] - The round-trip time of the session, in milliseconds. statistics[5] - Send Video codec type. statistics[6] - Frame width for the sent video. statistics[7] - Frame height for the sent video. statistics[8] - Bitrate in BPS for the sent video. statistics[9] - Frame rate for the sent video. statistics[10] - The number of received bytes. statistics[11] - The number of received packets. statistics[12] - The number of received but lost packet. statistics[13] - Fraction of received but lost packet in percentage. statistics[14] - Received Video codec type. statistics[15] - Frame width for the received video. statistics[16] - Frame height for the received video. statistics[17] - (This parameter is not implemented yet)Bitrate in BPS for the received video. statistics[18] - Framerate for the received video. statistics[19] - The number of sent bytes.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Audio effect functions

Functions

- void <u>com.portsip.PortSipSdk.enableVAD</u> (boolean state)
- void com.portsip.PortSipSdk.enableAEC (boolean state)
- void <u>com.portsip.PortSipSdk.enableCNG</u> (boolean state)
- void com.portsip.PortSipSdk.enableAGC (boolean state)
- void <u>com.portsip.PortSipSdk.enableANS</u> (boolean state)

Detailed Description

Function Documentation

void com.portsip.PortSipSdk.enableVAD (boolean state)

Enable/disable Voice Activity Detection(VAD).

Parameters

state	Set to true to enable VAD, or false to disable.

void com.portsip.PortSipSdk.enableAEC (boolean state)

Enable/disable AEC (Acoustic Echo Cancellation).

state	Set to true to enable AEC, or false to disable.
-------	---

void com.portsip.PortSipSdk.enableCNG (boolean state)

Enable/disable Comfort Noise Generator(CNG).

Parameters

state	Set to true to enable CNG, or false to disable.

void com.portsip.PortSipSdk.enableAGC (boolean state)

Enable/disable Automatic Gain Control(AGC).

Parameters

state	Set to true to enable AEC, or false to disable.

void com.portsip.PortSipSdk.enableANS (boolean state)

Enable/disable Audio Noise Suppression(ANS).

Parameters

state	Set to true to enable ANS, or false to disable.
-------	---

Send OPTIONS/INFO/MESSAGE functions

Functions

- int com.portsip.PortSipSdk.sendOptions (String to, String sdp)
- int com.portsip.PortSipSdk.sendInfo (long sessionId, String mimeType, String subMimeType, String infoContents)
- long <u>com.portsip.PortSipSdk.sendMessage</u> (long sessionId, String mimeType, String subMimeType, byte[] message, int messageLength)
- long <u>com.portsip.PortSipSdk.sendOutOfDialogMessage</u> (String to, String mimeType, String subMimeType, boolean isSMS, byte[] message, int messageLength)
- long com.portsip.PortSipSdk.setPresenceMode (int mode)
- long com.portsip.PortSipSdk.setDefaultSubscriptionTime (int secs)
- long com.portsip.PortSipSdk.setDefaultPublicationTime (int secs)
- long <u>com.portsip.PortSipSdk.presenceSubscribe</u> (String contact, String subject)
- int com.portsip.PortSipSdk.presenceTerminateSubscribe (long subscribeId)
- int com.portsip.PortSipSdk.presenceAcceptSubscribe (long subscribeId)
- int com.portsip.PortSipSdk.presenceRejectSubscribe (long subscribeId)
- int com.portsip.PortSipSdk.setPresenceStatus (long subscribeId, String statusText)
- long <u>com.portsip.PortSipSdk.sendSubscription</u> (String to, String eventName) Send a SUBSCRIBE message to subscribe an event.
- int com.portsip.PortSipSdk.terminateSubscription (long subscribeId)

Detailed Description

Function Documentation

int com.portsip.PortSipSdk.sendOptions (String to, String sdp)

Send OPTIONS message.

Parameters

to	The recipient of OPTIONS message.
sdp	The SDP of OPTIONS message. It's optional if user does not want to send the
	SDP with OPTIONS message.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return value a specific error code.

int com.portsip.PortSipSdk.sendInfo (long sessionId, String mimeType, String subMimeType, String infoContents)

Send a INFO message to remote side in dialog.

Parameters

sessionId	The session ID of call.
mimeType	The mime type of INFO message.
subMimeType	The sub mime type of INFO message.
infoContents	The contents that will be sent with INFO message.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

long com.portsip.PortSipSdk.sendMessage (long sessionId, String mimeType, String subMimeType, byte[] message, int messageLength)

Send a MESSAGE message to remote side in dialog.

Parameters

sessionId	The session ID of call.
mimeType	The mime type of MESSAGE message.
subMimeType	The sub mime type of MESSAGE message.
message	The contents that will be sent with MESSAGE message. Binary data allowed.
messageLength	The message size.

Returns

If the function succeeds, it will return a message ID that allows to track the message sending state in onSendMessageSuccess and onSendMessageFailure. If the function fails, it will return a specific error code that is less than 0.

Remarks

Example 1: Send a plain text message. Note: to send other languages text, please use the UTF8 to encode the message before sending.

```
sendMessage (sessionId, "text", "plain", "hello",6);
Example 2: Send a binary message.
sendMessage (sessionId, "application", "vnd.3gpp.sms", binData, binDataSize);
```

long com.portsip.PortSipSdk.sendOutOfDialogMessage (String to, String mimeType, String subMimeType, boolean isSMS, byte[] message, int messageLength)

Send a out of dialog MESSAGE message to remote side.

to	The message receiver. Likes sip:receiver@portsip.com
mimeType	The mime type of MESSAGE message.
subMimeType	The sub mime type of MESSAGE message.
isSMS	Set to YES to specify "messagetype=SMS" in the To line, or NO to disable.
message	The contents that will be sent with MESSAGE message. Binary data allowed.
messageLength	The message size.

If the function succeeds, it will return a message ID that allows to track the message sending state in onSendOutOfMessageSuccess and onSendOutOfMessageFailure. If the function fails, it will return a specific error code that is less than 0.

Remarks

Example 1: Send a plain text message. Note: to send other languages text, please use the UTF8 to encode the message before sending.

```
sendOutOfDialogMessage ("sip:userl@sip.portsip.com", "text", "plain", "hello", 6);
Example 2: Send a binary message.
sendOutOfDialogMessage ("sip:userl@sip.portsip.com", "application",
"vnd.3gpp.sms", binData, binDataSize);
```

long com.portsip.PortSipSdk.setPresenceMode (int mode)

Indicate the SDK uses the P2P mode for presence or presence agent mode.

Parameters

mode	0 - P2P mode; 1 - Presence Agent mode. Default is P2P mode.	
------	---	--

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

Since presence agent mode requires the PBX/Server support the PUBLISH, please ensure you have your server and PortSIP PBX support this feature. For more details please visit: https://www.portsip.com/portsip-pbx

long com.portsip.PortSipSdk.setDefaultSubscriptionTime (int secs)

Set the default expiration time to be used when creating a subscription.

Parameters

secs	The default expiration time of subscription.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

long com.portsip.PortSipSdk.setDefaultPublicationTime (int secs)

Set the default expiration time to be used when creating a publication.

Parameters

secs	The default expiration time of publication.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

long com.portsip.PortSipSdk.presenceSubscribe (String contact, String subject)

Send a SUBSCRIBE message for presence to a contact.

contact	The target contact, it must be in the format of sip: contact001@sip.portsip.com.
subject	This subject text will be inserted into the SUBSCRIBE message. For example:
	"Hello, I'm Jason".
	The subject maybe is in UTF8 format. You should use UTF8 to decode it.

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.presenceTerminateSubscribe (long subscribeld)

Terminate the given presence subscription.

Parameters

subscribeId	The ID of the subscription.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.presenceAcceptSubscribe (long subscribeld)

Accept the presence SUBSCRIBE request which received from contact.

Parameters

subscribeId	Subscription ID. When receiving a SUBSCRIBE request from contact, the
	event onPresenceRecvSubscribe will be triggered. The event includes the
	subscription ID.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.presenceRejectSubscribe (long subscribeld)

Reject a presence SUBSCRIBE request received from contact.

Parameters

subscribeId	Subscription ID. When receiving a SUBSCRIBE request from contact, the
	event onPresenceRecvSubscribe will be triggered. The event inclues the
	subscription ID.

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

int com.portsip.PortSipSdk.setPresenceStatus (long subscribeld, String statusText)

Send a NOTIFY message to contact to notify that presence status is online/offline/changed.

Parameters

subscribeId	Subscription ID. When receiving a SUBSCRIBE request from contact, the event onPresenceRecvSubscribe that includes the Subscription ID will be triggered.
statusText	The state text of presence status. For example: "I'm here", offline must use "offline"

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

long com.portsip.PortSipSdk.sendSubscription (String to, String eventName)

Send a SUBSCRIBE message to subscribe an event.

Parameters

to	The user/extension will be subscribed.
eventName	The event name to be subscribed.

Returns

If the function succeeds, it will return the ID of that SUBSCRIBE which is greater than 0. If the function fails, it will return a specific error code which is less than 0.

Remarks

Example 1, below code indicates that user/extension 101 is subscribed to MWI (Message Waiting notifications) for checking his voicemail: int32 mwiSubId = sendSubscription("sip:101@test.com", "message-summary");

Example 2, to monitor a user/extension call status, You can use code: sendSubscription(mSipLib, "100", "dialog"); Extension 100 refers to the user/extension to be monitored. Once being monitored, when extension 100 hold a call or is ringing, the onDialogStateUpdated callback will be triggered.

int com.portsip.PortSipSdk.terminateSubscription (long subscribeld)

Terminate the given subscription.

Parameters

subscribeId	The ID of the subscription.
-------------	-----------------------------

Returns

If the function succeeds, it will return value 0. If the function fails, it will return a specific error code.

Remarks

For example, if you want stop check the MWI, use below code:

terminateSubscription (mwiSubId);

Class Documentation

com.portsip.PortSipEnumDefine.AUDIOCODEC Interface Reference

The documentation for this interface was generated from the following file:

PortSipEnumDefine.java

com.portsip.PortSipEnumDefine.AudioDevice Enum Reference

Public Attributes

- SPEAKER PHONE
- WIRED_HEADSET
- EARPIECE
- BLUETOOTH
- NONE

Detailed Description

AudioDevice list possible audio devices that we currently support.

The documentation for this enum was generated from the following file:

• PortSipEnumDefine.java

Member Data Documentation

final int com.portsip.PortSipEnumDefine.ENUM_VIDEOCODEC_NONE = -1 [static]
Used in startRecord only

final int com.portsip.PortSipEnumDefine.ENUM_VIDEOCODEC_I420 = 133[static]

Used in startRecord only

final int

com.portsip.PortSipEnumDefine.ENUM_AUDIOSTREAM_LOCAL_PER_CHANNEL =
1[static]

Callback the audio stream from microphone for one channel base on the session ID

final int

com.portsip.PortSipEnumDefine.ENUM_AUDIOSTREAM_REMOTE_PER_CHANNEL =
2[static]

Callback the received audio stream for one channel base on the session ID.

final int

com.portsip.PortSipEnumDefine.ENUM_AUDIOSTREAM_BOTH_PER_CHANNEL =
3[static]

Callback microphone and received audio stream for one channel based on the session ID.

final int com.portsip.PortSipEnumDefine.ENUM_VIDEOSTREAM_NONE = 0 [static]
Disable video stream callback

final int com.portsip.PortSipEnumDefine.ENUM_VIDEOSTREAM_LOCAL = 1[static]

Local video stream callback

final int com.portsip.PortSipEnumDefine.ENUM_VIDEOSTREAM_REMOTE = 2[static]

Remote video stream callback

- final int com.portsip.PortSipEnumDefine.ENUM_VIDEOSTREAM_BOTH = 3[static]

 Both of local and remote video stream callback
- final int com.portsip.PortSipEnumDefine.ENUM_RECORD_MODE_NONE = 0[static]
 Not Recorded.
- final int com.portsip.PortSipEnumDefine.ENUM_RECORD_MODE_RECV = 1[static]
 Only record the received data.
- final int com.portsip.PortSipEnumDefine.ENUM_RECORD_MODE_SEND = 2[static]
 Only record the sent data.
- final int com.portsip.PortSipEnumDefine.ENUM_RECORD_MODE_BOTH = 3[static]

 Record both received and sent data.

Version

17

The documentation for this class was generated from the following file:

• PortSipSdk.java

com.portsip.PortSIPVideoRenderer Class Reference

Inherits SurfaceViewRenderer.

Classes

enum ScalingType

Public Member Functions

- PortSIPVideoRenderer (Context context)
- PortSIPVideoRenderer (Context context, AttributeSet attrs)
- void **setScalingType** (ScalingType scalingType)
- void <u>release</u> ()
- void **surfaceDestroyed** (SurfaceHolder holder)
- void **renderFrame** (VideoRenderer.I420Frame frame)

Public Attributes

• long nativeVideoRenderer = 0

Detailed Description

Display the video stream on a SurfaceView.

Constructor & Destructor Documentation

com.portsip.PortSIPVideoRenderer.PortSIPVideoRenderer (Context context)

Standard View constructor. In order to render something, you must first call init().

com.portsip.PortSIPVideoRenderer.PortSIPVideoRenderer (Context context, AttributeSet attrs)

Standard View constructor. In order to render something, you must first call init().

Member Function Documentation

void com.portsip.PortSIPVideoRenderer.release ()

Block until any pending frame is returned and all GL resources released, even if an interrupt occurs. If an interrupt occurs during release(), the interrupt flag will be set. This function should be called before the Activity is destroyed and the EGLContext is still valid. If you don't call this function, the GL resources might leak.

The documentation for this class was generated from the following file:

PortSIPVideoRenderer.java

com.portsip.PortSIPVideoRenderer.ScalingType Enum Reference

Public Attributes

- SCALE_ASPECT_FIT
- SCALE_ASPECT_FILLSCALE_ASPECT_BALANCED

The documentation for this enum was generated from the following file:
